

# Multi robot systems

---

**Schnebli Zoltán**<sup>1</sup>

<sup>1</sup>Babeş-Bolyai University, Faculty of Mathematics and Computer Science

- **Motivation?**
- Automization
- Make robots do complex tasks by themselves

## Collaborative Multi-Robot Exploration

- Minimizes time
- Constructs a map about the environment

## Process

- send each agent to the closest *frontier* cell
- decrease the utility value of a point if a robot is nearby
- construct the map if there are no unknown points

# Collaborative multi-robot exploration

- with the use of relative position

# Collaborative multi-robot exploration

Experiments:

- randomly placed robots
- 2, 3, 4 robots
- increasing the map size with the nr. of robots
- faster with 100s, 200, 300s then the non-optimized

# Collaborative multi-robot exploration

- Results with the 2 robots

## Multi-Robot System for Artistic Pattern Formation

- make robots form a pattern
- make the transition between pattern smooth and efficient

## Use case of pattern formation

- exploration
- alignment of aerial vehicles
- cooperative control over a mobile network
- escorting and rescue mission

# Multi-robot system for artistic pattern formation

## Ideea

- creating goal positions from the input pattern
- multi-robot goal assignment
- (short path and fast convergence)
- avoid collision
- repeat step 2 until finished

# Multi-robot system for artistic pattern formation

# Multi-robot system for artistic pattern formation

Thanks for watching
